Add WeChat powcoder

# LL(1) Parsing Table

- One dimension: nonterminal to expand
- Other dimension: lookahead token

	a
A	$\alpha$

- E.g., entry “nonterminal A on terminal a” contains production  $A \rightarrow \alpha$
- Meaning: when parser is at nonterminal A and lookahead token is a, then parser expands A by production  $A \rightarrow \alpha$

# LL(1) Parsing Table

$start \rightarrow expr \$\$$

$expr \rightarrow term \ term\_tail$

$term \rightarrow id \ factor\_tail$

$term\_tail \rightarrow + \ term \ term\_tail \mid \epsilon$

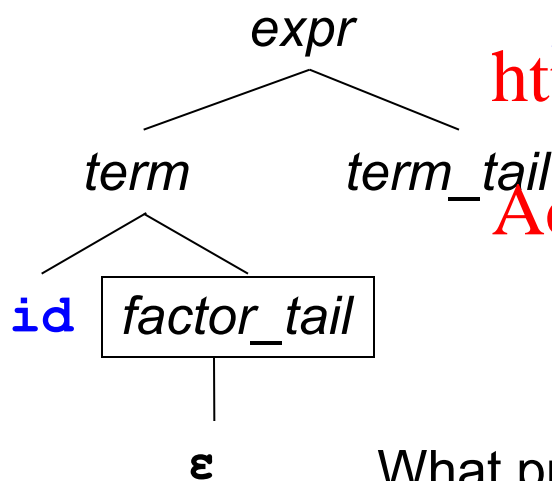

$factor\_tail \rightarrow * \ id \ factor\_tail \mid \epsilon$

	$id$	$+$	$*$	$\$ \$$
$start$	$expr \$ \$$	-	-	-
$expr$	$term \ term\_tail$	-	-	-
$term\_tail$	-	$+ \ term \ term\_tail$	-	$\epsilon$
$term$	$id \ factor\_tail$	-	-	-
$factor\_tail$	-	$\epsilon$	$* \ id \ factor\_tail$	$\epsilon$

# Intuition

## ■ Top-down parsing

- Parse tree is built from the top to the leaves
- Always expand the leftmost nonterminal

$$\begin{aligned} \text{expr} &\rightarrow \text{term } \text{term\_tail} \\ \text{term\_tail} &\rightarrow + \text{term } \text{term\_tail} \mid \epsilon \\ \text{term} &\rightarrow \text{id } \text{factor\_tail} \\ \text{factor\_tail} &\rightarrow * \text{id } \text{factor\_tail} \mid \epsilon \end{aligned}$$

id + id + id \* id  
<https://powcoder.com>

Add WeChat powcoder

$$\begin{aligned} \text{factor\_tail} &\rightarrow * \text{id } \text{factor\_tail} \\ \text{factor\_tail} &\rightarrow \epsilon \end{aligned}$$

What production applies for *factor\_tail* on +?  
+ does not belong to an expansion of *factor\_tail*.  
However, *factor\_tail* has an epsilon production and + belongs to an expansion of *term\_tail* which follows *factor\_tail*. Thus, predict the epsilon production.

# Intuition

## ■ Top-down parsing

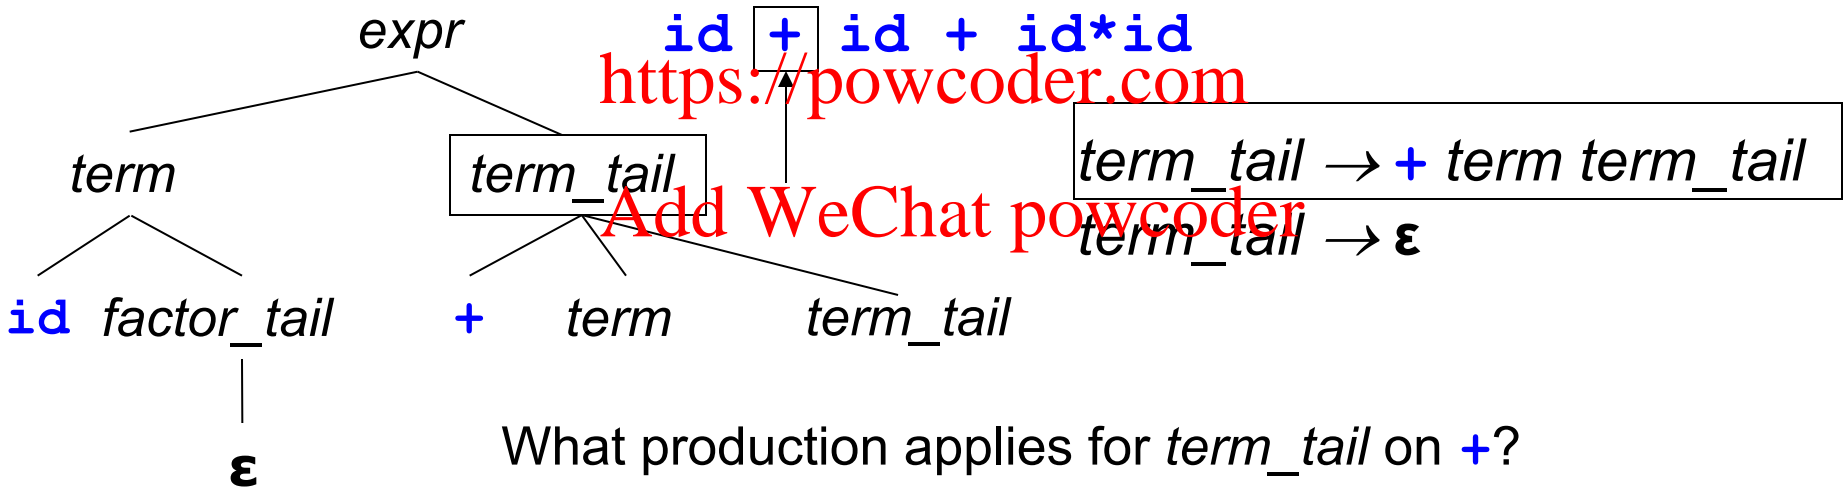

- Parse tree is built from the top to the leaves
- Always expand the leftmost nonterminal

$expr \rightarrow term\ term\_tail$   
 $term\_tail \rightarrow +\ term\ term\_tail \mid \epsilon$   
 $term \rightarrow id\ factor\_tail$   
 $factor\_tail \rightarrow * id\ factor\_tail \mid \epsilon$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

What production applies for  $term\_tail$  on  $+$ ?

$+$  is the **first** symbol in expansions of  $+\ term\ term\_tail$ .

Thus, predict production  $term\_tail \rightarrow +\ term\ term\_tail$

# LL(1) Tables and LL(1) Grammars

---

- We can construct an LL(1) parsing table for any context-free grammar
  - In general, the table will contain multiply-defined entries. That is, for some nonterminal and lookahead token, more than one production applies.
- A grammar whose LL(1) parsing table has no multiply-defined entries is said to be LL(1) grammar
  - LL(1) grammars are a very special subclass of context-free grammars. Why?

# FIRST and FOLLOW sets

---

- Let  $\alpha$  be any sequence of nonterminals and terminals
  - **FIRST**( $\alpha$ ) is the set of terminals **a** that begin the strings derived from  $\alpha$ . E.g.,  $expr \Rightarrow^* id...$ , thus **id** in **FIRST**( $expr$ )
  - If there is a derivation  $\alpha \Rightarrow^* \epsilon$ , then  $\epsilon$  is in **FIRST**( $\alpha$ )

Add WeChat powcoder

- Let  $A$  be a nonterminal
  - **FOLLOW**( $A$ ) is the set of terminals **b** (including special end-of-input marker  $\$$ ) that can appear immediately to the right of  $A$  in some sentential form:  
 $start \Rightarrow^* \dots A b \dots \Rightarrow^* \dots$

# Computing FIRST

Notation:

$\alpha$  is an arbitrary sequence of terminals and nonterminals

- Apply these rules until no more terminals or  $\epsilon$  can be added to any  $\text{FIRST}(\alpha)$  set

(1) If  $\alpha$  starts with a terminal  $a$ , then  $\text{FIRST}(\alpha) = \{ a \}$

(2) If  $\alpha$  is a nonterminal  $X$ , where  $X \rightarrow \epsilon$ , then add  $\epsilon$  to  $\text{FIRST}(\alpha)$

(3) If  $\alpha$  is a nonterminal  $X \rightarrow Y_1 Y_2 \dots Y_k$ , then add  $a$  to  $\text{FIRST}(X)$  if for some  $i$ ,  $a$  is in  $\text{FIRST}(Y_i)$  and  $\epsilon$  is in all of  $\text{FIRST}(Y_1), \dots, \text{FIRST}(Y_{i-1})$ . If  $\epsilon$  is in all of  $\text{FIRST}(Y_1), \dots, \text{FIRST}(Y_k)$ , add  $\epsilon$  to  $\text{FIRST}(X)$ .

- Everything in  $\text{FIRST}(Y_1)$  is surely in  $\text{FIRST}(X)$
- If  $Y_1$  does not derive  $\epsilon$ , then we add nothing more;

Otherwise, we add  $\text{FIRST}(Y_2)$ , and so on

Similarly, if  $\alpha$  is  $Y_1 Y_2 \dots Y_k$ , we'll repeat the above

# Warm-up Exercise

$start \rightarrow expr \$\$$

$expr \rightarrow term \ term\_tail$

$term \rightarrow id \ factor\_tail$

$term\_tail \rightarrow + \ term \ term\_tail \mid \epsilon$

$factor\_tail \rightarrow * \ id \ factor\_tail \mid \epsilon$

FIRST( $term$ ) = {  $id$  }

FIRST( $expr$ ) = <https://powcoder.com>

FIRST( $start$ ) = Add WeChat powcoder

FIRST( $term\_tail$ ) =

FIRST( $+ \ term \ term\_tail$ ) =

FIRST( $factor\_tail$ ) =

# Exercise

$start \rightarrow S \$\$$	$B \rightarrow \mathbf{z} S \mid \epsilon$
$S \rightarrow \mathbf{x} S \mid A \mathbf{y}$	$C \rightarrow \mathbf{v} S \mid \epsilon$
$A \rightarrow BCD \mid \epsilon$	$D \rightarrow \mathbf{w} S$

Assignment Project Exam Help

Compute FIRST sets:

FIRST( $A \mathbf{y}$ ) = Add WeChat [powcoder](https://powcoder.com) FIRST( $A$ ) =

FIRST( $BCD$ ) = FIRST( $B$ ) =

FIRST( $\mathbf{z} S$ ) = FIRST( $C$ ) =

FIRST( $\mathbf{v} S$ ) = FIRST( $D$ ) =

FIRST( $\mathbf{w} S$ ) =

# Computing FOLLOW

Notation:

$A, B, S$  are nonterminals.

$\alpha, \beta$  are arbitrary sequences of terminals and nonterminals.

- Apply these rules until nothing can be added to any FOLLOW( $A$ ) set

(1) If there is a production  $A \rightarrow \alpha B \beta$ , then everything in FIRST( $\beta$ ) except for  $\epsilon$  should be added to FOLLOW( $B$ )

<https://powcoder.com>  
Add WeChat powcoder

(2) If there is a production  $A \rightarrow \alpha B$ , or a production  $A \rightarrow \alpha B \beta$ , where FIRST( $\beta$ ) contains  $\epsilon$ , then everything in FOLLOW( $A$ ) should be added to FOLLOW( $B$ )

# Warm-up

$start \rightarrow expr \$\$$

$expr \rightarrow term \ term\_tail$

$term \rightarrow id \ factor\_tail$

$term\_tail \rightarrow + \ term \ term\_tail \mid \epsilon$

$factor\_tail \rightarrow * \ id \ factor\_tail \mid \epsilon$

FOLLOW( $expr$ ) = {  $\$$  }

FOLLOW( $term\_tail$ ) =

FOLLOW( $term$ ) =

FOLLOW( $factor\_tail$ ) =

# Exercise

$start \rightarrow S \$\$$	$B \rightarrow \mathbf{z} S \mid \epsilon$
$S \rightarrow \mathbf{x} S \mid A \mathbf{y}$	$C \rightarrow \mathbf{v} S \mid \epsilon$
$A \rightarrow BCD \mid \epsilon$	$D \rightarrow \mathbf{w} S$

Assignment Project Exam Help  
Compute FOLLOW sets:

$FOLLOW(A) =$  <https://powcoder.com>

$FOLLOW(B) =$  Add WeChat powcoder

$FOLLOW(C) =$

$FOLLOW(D) =$

$FOLLOW(S) =$

# PREDICT Sets

---

**PREDICT**( $A \rightarrow \alpha$ ) =

- FIRST**( $\alpha$ )  
if  $\alpha$  does not derive  $\epsilon$
- (FIRST**( $\alpha$ ) - **{ $\epsilon$ }**) **U FOLLOW**( $A$ )  
if  $\alpha$  derives  $\epsilon$

# Constructing LL(1) Parsing Table

---

- Algorithm uses PREDICT sets:

foreach production  $A \rightarrow \alpha$  in grammar  $G$   
  foreach terminal  $a$  in  $\text{PREDICT}(A \rightarrow \alpha)$   
    add  $A \rightarrow \alpha$  into entry  $\text{parse\_table}[A, a]$

- If each entry in  $\text{parse\_table}$  contains at most one production, then  $G$  is said to be LL(1)

# Exercise

$start \rightarrow S \$\$$	$B \rightarrow \mathbf{z} S \mid \epsilon$
$S \rightarrow \mathbf{x} S \mid A \mathbf{y}$	$C \rightarrow \mathbf{v} S \mid \epsilon$
$A \rightarrow BCD \mid \epsilon$	$D \rightarrow \mathbf{w} S$

Assignment Project Exam Help

PREDICT( $A \rightarrow \epsilon$ ) =

... etc...

# Writing an LL(1) Grammar

- Most context-free grammars are not LL(1) grammars

- Obstacles to LL(1)-ness

Assignment Project Exam Help

- Left recursion is an obstacle. Why?

https://powcoder.com  
Add WeChat powcoder

```
expr → expr + term | term  
term → term * id | id
```

- Common prefixes are an obstacle. Why?

```
stmt → if b then stmt else stmt |  
      if b then stmt |  
      a
```

# Removal of Left Recursion

- Left recursion can be removed from a grammar mechanically
- Started from this left-recursive expression grammar:

<https://powcoder.com>  
$$\begin{aligned} \text{expr} &\rightarrow \text{expr} + \text{term} \mid \text{term} \\ \text{term} &\rightarrow \text{term} * \text{id} \mid \text{id} \end{aligned}$$
  
Add WeChat powcoder

- After removal of left recursion we obtain this equivalent grammar, which is LL(1):

$$\begin{aligned} \text{expr} &\rightarrow \text{term} \text{ term\_tail} \\ \text{term\_tail} &\rightarrow + \text{term} \text{ term\_tail} \mid \epsilon \\ \text{term} &\rightarrow \text{id} \text{ factor\_tail} \\ \text{factor\_tail} &\rightarrow * \text{id} \text{ factor\_tail} \mid \epsilon \end{aligned}$$

# Removal of Common Prefixes

- Common prefixes can be removed mechanically as well, by using **left-factoring**
- Original if-then-else grammar:

$stmt \rightarrow \text{if } b \text{ then } stmt \text{ else } stmt \mid$   
 $\text{if } b \text{ then } stmt \mid$   
 $a$

- After left-factoring:

$stmt \rightarrow \text{if } b \text{ then } stmt \text{ else\_part} \mid a$   
 $\text{else\_part} \rightarrow \text{else } stmt \mid \epsilon$

# Exercise

$start \rightarrow stmt \$\$$

$stmt \rightarrow \text{if } b \text{ then } stmt \text{ else\_part} \mid a$

$else\_part \rightarrow \text{else } stmt \mid \epsilon$

- Compute FIRSTs:

$FIRST(stmt \$\$)$ ,  $FIRST(\text{if } b \text{ then } stmt \text{ else\_part})$ ,  
 $FIRST(a)$ ,  $FIRST(\text{else } stmt)$

Assignment Project Exam Help

- Compute FOLLOW: <https://powcoder.com>

$FOLLOW(else\_part)$

# Bottom-up Parsing

---

- Also called LR parsing
- LR parsers work with LR(k) grammars
  - L stands for “left-to-right” scan of input
  - R stands for “rightmost” derivation
  - k stands for “need k tokens of lookahead”
- We are interested in LR(0) and LR(1) and variants in between
- LR parsing is better than LL parsing!
  - Accepts larger class of languages
  - Just as efficient!

# LR Parsing

---

- The parsing method used in practice
  - LR parsers recognize virtually all PL constructs
  - LR parsers recognize a much larger set of grammars than predictive parsers
  - LR parsing is efficient
- LR parsing variants
  - SLR (or Simple LR)
  - LALR (or Lookahead LR) – **yacc/bison** generate LALR parsers
  - LR (Canonical LR)
  - $SLR < LALR < LR$

# Main Idea

---

- Stack  $\leftarrow$  Input
- Stack: holds the part of the input seen so far
  - A string of both terminals and nonterminals
- Input: holds the remaining part of the input
  - A string of terminals
- Parser performs two actions
  - **Reduce**: parser pops a “suitable” production right-hand-side off top of stack, and pushes production’s left-hand-side on the stack
  - **Shift**: parser pushes next terminal from the input on top of the stack

# Example

---

- Recall the grammar

$expr \rightarrow expr + term \mid term$

$term \rightarrow term * id \mid id$

<https://powcoder.com>

- This is not LL(1) because it is left recursive
- LR parsers can handle left recursion!

- Consider string

`id + id * id`

$id + id * id$

---

Stack

Input

Action

$id + id * id$

shift  $id$

$id$

$+ id * id$

reduce by  $term \rightarrow id$

$term$

$+ id * id$

reduce by  $expr \rightarrow term$

$expr$

$+ id * id$

shift  $+$

$expr +$

$id * id$

shift  $id$

$expr + \underline{id}$

$* id$

reduce by  $term \rightarrow id$

$expr \rightarrow expr + term \mid term$   
 $term \rightarrow term * id \mid id$

*id + id\*id*

---

Stack

Input Action

*expr+term*

*\*id* shift *\**

*expr+term\**

*id* shift *id*

*expr+term\*id*

reduce by *term → term \* id*

*expr+term*

reduce by *expr → expr + term*

*expr*

ACCEPT, SUCCESS

*expr → expr + term | term*  
*term → term \* id | id*

# $id + id * id$

---

Sequence of reductions performed by parser

↑

$id + id * id$	• A rightmost derivation in
$term + id * id$	reverse
$expr + id * id$	<a href="https://powcoder.com">https://powcoder.com</a>
$expr + term * id$	• The stack (e.g., $expr$ )
$expr + term$	concatenated with remaining
$expr$	input (e.g., $+ id * id$ ) gives a
	sentential form ( $expr + id * id$ )
	in the rightmost derivation

$$expr \rightarrow expr + term \mid term$$
$$term \rightarrow term * id \mid id$$

# The End
